

GradeSense Examination - Answer Sheet

Q1. Science

A simple electric circuit is a closed path which allows the electric current to flow through it. The battery gives the potential difference which pushes the current around the circuit. The switch is used to open and close the circuit. When the switch is closed the path is complete and the current flows through the bulb and the resistor, and when the switch is open the circuit is broken so no current flows.

The battery, switch, resistor, bulb and ammeter are all joined one after another in series in the main circuit. The ammeter is placed in series because it has to measure the current going through the circuit. The voltmeter is also connected in series with the bulb so that it can measure the voltage of the bulb.

If the resistance of the circuit is increased then the current in the circuit will also increase, because a bigger resistance pushes more current through the wires.

Q2. English

I think technology has made students better learners. Today a student can find any information in a few seconds on the internet and there are many videos and websites which explain difficult topics in a simple way. For example if a student does not understand a science concept in the class, he can watch a video at home and learn it again at his own speed.

Technology also saves a lot of time for the students and it is much easier than going to a library. So technology is good for learning.

Q3. Economics

The graph is drawn with the price on the horizontal axis and the quantity on the vertical axis. The demand line goes down from left to right and the supply line goes up, and the two lines cut each other at one point.

The equilibrium point is at the price of Rs 30 and the quantity is 60 units, because at this price the quantity demanded and the quantity supplied are equal to each other.

When the price is below the equilibrium price there is a surplus in the market, because the sellers have more goods than the buyers want to buy at that price.

If the cost of production increases the producers will supply more, so the supply curve will shift to the right on the graph.
